

English Two-Column Regression Sample

Fixed fixture · no private data · 2026

Abstract

Functional materials with photo-regulated transitions can reversibly change their mechanical and thermal properties. This synthetic paper verifies two-column ordering, headings, paragraphs, and figure captions.

Introduction

Academic PDFs frequently arrange prose in two columns. A reader must reconstruct a continuous semantic flow without interleaving unrelated sentences from neighboring columns.

The target phrase is GREEN LIGHT PHOTOTHERMAL TRANSITION. Search should locate it and return the correct page, section, and evidence block.

Figure 1. Synthetic response under green-light irradiation.

Methods

Samples were irradiated at 532 nm for ten minutes. Temperature, storage modulus, and phase state were recorded. All values are synthetic and exist only for parser regression.

Results

The transition was reversible over five cycles. No user document, account identifier, API token, or production record is present in this fixture.

Conclusion

The fixture is intentionally short while preserving a realistic scholarly hierarchy.
